Client/Server for SQL Server

### JOB♦OPS Product Configurator Functions

- A rules-based system.
- User-friendly interface.
- Flexibility in parts pricing.
- Parts scalability.
- Configuration templates.
- Automatic creation of work ticket.
- Graphical display.
- "Smart part" generation.
- Robust calculating ability.
- "Test drive" capabilities.

### JOB OPERATIONS & PRODUCTION SYSTEM

The JOB♦OPS Configurator is a sophisticated, yet user-friendly rules-based configuration engine that integrates the abilities of the MAS 90 and MAS 200 product line and JOB♦OPS to improve procurement and production workflow processes and enhance customer service. By enabling JOB♦OPS — a graphically based job operations and production system — to run completely within the MAS 90 or MAS 200 sales order entry system, the Configurator takes this software solution to new heights of performance and functionality.

The JOB♦OPS Configurator is the ideal tool for companies offering customized products and services, from custom-built furniture to video conference room installation. Order entry operators can use the system to pose a series of questions to the

customer, capture responses, and construct a detailed description, including pricing, and a complete work ticket with instructions, parts and budgets.

JOB♦OPS Configurator provides a robust tool for gathering information about an order and then constructing the order, based upon that information, with all budgetary and inventory requirements in place. For companies constructing products with multiple variations, such as length, width or color, this product configuration system can help manage resources and monitor expenses more efficiently. Through seamless integration with MAS 90 and MAS 200, critical operations and financial information can be accessed from a single source, further enhancing efficiency.

## FEATURES

### JOB♦OPS Configurator from BDO Seidman, LLP

#### A Rules-Based System

The JOB♦OPS Configurator works around a series of rules that are built when the configuration is constructed. These rules determine which features/options are available with other features/options. The rules operate at all design levels, including parts for quantity, pricing and inclusion.

#### User-Friendly Interface

The system walks the order entry operator through a series of questions/features, which may be a number (i.e., length, height or quantity) or an option (i.e., wood type or color).

#### Flexibility in Parts Pricing

Parts can be priced manually, using standard MAS 90 and MAS 200 pricing rules, or scripted rules.

#### Parts Scalability

Parts are scalable by parent item, feature quantity and parent item, or by scripted rules.

#### Configuration Templates

Configuration templates, that include common sets of user responses, can be easily created to help save time and improve efficiency.

#### Automatic Creation of Work Ticket

The system automatically creates a work ticket, that includes parts, budget, and descriptions based on the user's responses captured during the configuration. An existing JOB♦OPS template is embedded into the work ticket as a framework. JOB♦OPS Configurator can also explode bills of materials for any designated part during work ticket generation, and has the ability to associate features to a specific work ticket process.

#### Graphical Display

A bitmap image display is available for features and options.

#### Smart Part Generation

An optimal "smart part" code readily identifies the part's unique features and options, and may be used internally to label a finished good.

#### Robust Calculating Ability

JOB♦OPS Configurator can establish setup and run-time labor calculations based on user selections.

#### "Test Drive" Capabilities

The system gives users the ability to "test drive" their configuration before deployment.
